CORRECTIONS FOR *BEGINNING MATHEMATICAL LOGIC*

PETER SMITH

My policy for updating the text of the printed book will be as follows.

(1) I won't update the printed book every time I'm told about a minor typo. However, when I discover one way or another that a passage is sufficiently *badly* wrongly, i.e. could seriously mislead, then I will upload a revised file to Amazon, making the needed correction (and then take the opportunity to make minor corrections at the same time).

(2) Significant revisions in the sense of new explanatory content or recommendations will wait until the second edition of the book.

TABLE 1. *Corrections for original printed version*

page/line	from	to
p. 44, l. −13	§11.3	§13.3
p. 77	(Instead of para 2.)	Note too that a real number between 0 and 1 can be represented in binary by an infinite string. And, by the same argument as before, for any countable list of reals-in-binary between 0 and 1, there will be another such real not on the list. Hence the set of real numbers between 0 and 1 is again not countably infinite. Hence neither is the set of *all* the reals.
p. 163, l. −1	Leonard	Leonid
